

Tuesday 2nd March 2021 **OLI: To understand differences between living things.**
We are carrying on with our journey through the animals that live on planet Earth.
Look at the following ones and try to match the correct fact to each one of them.
Afterwards, guess what place these animals live in and look at it on the globe.

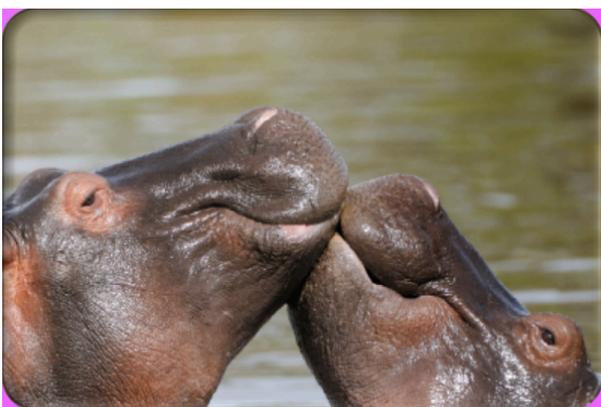

It is impossible to find two of this animal that have the same pattern on their body.

Their nose, ears and eyes are on top of their head and they stick out above the water, allowing them to hear, see and breath while their body is submerged.

They use their nose, called trunk, to hug.

The male of this animal has something called 'mane' (lots of hair around their head).
